Responsible AI Role-Play Exercise Sheet

Exercise Instructions:

- **Step 1: Form groups (1–5 people)**
  Each student selects at least 1 role.
  - Deployer (the Business Stakeholder who want to apply the solution)
  - Developing company and AI developer (those who sell or develop the system)
  - Impacted Citizen or End User (for example patient)
  - Regulator

- **Step 2: Choose one of the below listed use-cases** and discuss the system from each stakeholder's point of view. Use the guiding questions provided.

- **Step 3: Present as a panel (5–7 min) highlighting:**
  - Concerns, possible risks and biases
  - How to mitigate the risks
  - Your estimate on AI EU Act risk category

Use-Cases:

1- **AI Resume Screening System**
What it is: An AI tool that automatically filters job applications using Natural Language Processing (NLP) and machine learning.
Why it's used: save time in hiring by identifying top candidates from large applicant pools.
Training data: Historical CVs, cover letters, and recruiter evaluation notes from past hires.

2- **Predictive Policing Algorithm**
What it is: An AI system that forecasts crime-prone areas or individuals based on prior crime statistics.
Why it's used: To allocate law enforcement resources more efficiently and preemptively reduce crime.
Training data: Police reports, crime location data, arrest records, and historical offense patterns.

3- **Facial Recognition in Public Transport**
What it is: A facial recognition system installed in metro/subway systems to identify persons of interest in real time.
Why it's used: To enhance public safety by identifying suspects or preventing security threats.
Training data: Facial image databases, security footage, and law enforcement watchlists—often trained on Western facial datasets.

4- **AI Medical Diagnostic Tool**
What it is: An AI system that analyzes radiology images (e.g., X-rays) to detect early signs of diseases like lung cancer.
Why it's used: To support doctors with faster and potentially more accurate diagnostics, especially in resource-constrained settings.
Training data: Labeled medical imaging datasets (e.g., CT scans, X-rays) with diagnosis information from previous patient cases.

5- **Generative AI for Student Essays**
What it is: A generative AI chatbot that can create entire essays or reports on demand based on a prompt.
Why it's used: For idea generation, writing assistance, or completing academic assignments quickly.
Training data: Large-scale internet text, educational content, books, and articles used to train language models.
